

Follow-Ups from the Management Discussion

Benefit Street Partners · prepared with Union Square Advisors · July 2026

Thank you again to the TCN team for a substantive session. Two follow-ups would help us complete our work: the product demonstration the team suggested as a separate session, and a short list of written items. We would appreciate scheduling the demonstration this week if the team's calendar allows.

1 Product demonstration session (~45 minutes, this week)

- A **live** AI Voice Agent session on the production environment: an end-to-end collections interaction including compliance disclosures, a negotiation or payment-plan turn, and escalation to a human agent. Unscripted interaction would be most useful.
- A brief **live configuration** walk-through: standing up a simple agent (e.g., KYC) as described on the call, so we can see the "configuration, not code" motion and typical time-to-live first-hand.
- Early performance data from production deployments: containment / automation rate and cost per resolution, however preliminary.
- A short **SmartAMD demonstration** in the same session: live dials against an iOS device with call screening enabled, a Pixel with Call Screen, and a standard voicemail box, showing the classification and resulting action in real time, together with the reporting view and how the uplift metrics are measured.

2 Written items

- **Retention bridge:** gross revenue retention for the trailing 8 quarters, split churn vs. downsell, by segment or cohort, reflecting the upsell/downsell dynamics discussed on the call.
- **ARR composition:** committed minimums / platform fees vs. volume-based billing, as of Q2 2026.
- **Virtual agent funnel:** the ~150 evaluating / 8-15 implementing / production customers referenced on the call, with associated ARR, use cases, and go-live dates (anonymized profiles are fine).
- **SmartAMD:** the cohort data behind the ~\$600K ARR pace and the uplift metrics cited (talk-off lift, screened-call recovery, collections impact), plus current attach and pricing.
- **Technology stack:** confirmation of which voice-agent components are in-house models vs. licensed engines (in particular speech-to-text and text-to-speech), and current LLM vendor arrangements.
- **AI organization:** who leads AI product and engineering day to day, senior AI hires and backgrounds, and AI-dedicated headcount within the engineering organization.
- **AI roadmap:** the 12-24 month roadmap with expected timing and owners, including the predictive-optimization and real-time audio intelligence initiatives referenced in the CIP.
- **Third-party agents:** the number of customers running third-party virtual agents through the TCN platform today, and how TCN participates commercially in those interactions.
